## 1. Introduction

The files for the Living Conditions Survey 1999 (hereinafter ECV99) for families and individuals constitute a product for dissemination directed at users with experience in analysing and treating microdata. This format provides added value to users, enabling them to carry out data operations and analyses which, for obvious limitations, cannot be addressed by the current standard dissemination in the form of tables, publications and reports.

Specifically, the microdata file corresponding to the family survey is described in this report. This file contains a selection of the variables collected and generated in the survey for the person selected within the family environment and is structured based on the thematic aspects addressed by the survey for this statistical unit (education level, health conditions, work, free time, social relationships, etc.)<sup>1</sup>. There is also a microdata file available at a family level that contains specific information collected and generated by the survey for this statistical unit. This file is provided separately together with its corresponding description.

## 2. Criteria for selection of variables

The ECV covers an infinite range of variables and characteristics at a family and individual level that must be processed, cleansed and synthesised before use. The file described here covers a selection of these variables already prepared for use. This selection of variables has been carried out based on the confidentiality and quality criteria detailed following:

### 2.1 Confidentiality criteria

Maintaining the statistical secrecy of the informants is one of the main premises that govern this statistical activity. Therefore, the dissemination of any individual information collected under statistical secrecy must be anonymous and must not be associated with any specific individual, not even via the content or disaggregation of the disseminated variables.

Therefore, and in order to guarantee this safeguard, the following restrictions have been applied to the ECV 1999 individuals file:

- Under no circumstances are direct identification variables or data of a personal nature (national identity document, name, surname, addresses, telephone numbers, etc.) to be included.
- The maximum geographical breakdown included is the AREA (district grouping) and capitals of the province.
- The age of the person surveyed is presented in five-year groups given the high identifying power in combination with the rest of the geographic variables.
- Standard groups of variables are used that classify the individual and that do not allow the identification of "individual" units (e.g. individuals with minority professions, or with low frequency holiday destinations, etc.).
- Numeric variables are not included (e.g. career duration, distances to work and study centres, hours dedicated to study, etc.), except the family elevator and the family and individual identifiers. These variables are classified in ranges or intervals of sufficient magnitude.

---

<sup>1</sup> For further information, consult the questionnaire and the documentation related to the survey at [www.eustat.eus](http://www.eustat.eus)

- With respect to the sensitive subject areas covered in the survey, only the most important synthetic areas have been included once the possibility of record identification has been discounted. Health status variables that detail the nature of diseases and illnesses, mobility restrictions, consultations with certain specialists, type of prosthesis used and certain donor typologies have been discounted for inclusion. Participation, membership or support in organisations and/or associations of a religious, political or union nature are also grouped into a single generic category "Other organisations and associations".

## **2.2. Quality criteria**

Data quality is another aspect to consider in the analysis and treatment of statistical products. The quality of the statistical product can be defined based on certain quality factors promulgated by EUROSTAT: Suitability, precision and reliability, opportunity and punctuality, consistency and comparability, accessibility and clarity.

In this case, and for the selection of variables to include in the ECV individuals microdata file, the focus has been on two main aspects: Suitability (relevance or interest of the data to the final user) and the precision and reliability of the information.

### **2.2.1 Relevance**

Given the large quantity of variables collected by the survey, the aim has been to include those assumed to be of greater interest and relevance to the generic user. Therefore the following considerations have been made:

- Variables of little analytical interest have not been included as is the case with certain work and free time variables (e.g. typology of schedule control at work, distribution of holiday days in the holiday periods, schedules on holidays, etc.).
- On the other hand, detailed variables of the topics most demanded by the user in recent years is included, such as the use and level of Basque, the participation in domestic chores, the use of ICTs in leisure time, etc.
- Self-classification variables<sup>2</sup> have not been included in order to avoid problems of objectivity and comparability of the estimations derived from these variables (e.g. occupation, unemployment data, etc.).

### **2.2.2 Precision and reliability**

The main limitation in any survey by sample is due to the availability of information solely for the sample units and not for the total objective population. The sampling design of the survey will shed light on the level of representativeness that can be achieved with the information collected.

In the case of the ECV, although the sample of homes was selected in a stratified manner by ARA (or group of regions), the level of representativeness required is, at least, that of the province for the main variables and crosses in the survey. However, the large number of variables and the high level of detail that can be achieved with the variables included in this file do not guarantee the statistical significance of all the operations or analyses that can be performed on this data.

---

<sup>2</sup> One self-classification variable is that it is the survey itself that defines a certain category according to its subjective perception.

The conclusions derived from studies or analyses performed on this data are the responsibility of the end user.

### 3. Register design

The ECV 1999 individuals microdata file is in CSV format and is structured around the thematic areas collected by the survey for this statistical unit. The description of the variables, the type and the possible states are described in the Excel file *Estructura\_individuos\_ECV99.xls*, which is attached together with all the related documentation with the ECV 1999 microdata file.

### 4. Synthetic indicators

Some of the variables included in this microdata file do not correspond exactly with the individual questionnaire questions, but to synthetic variables derived from the use of several items or questions in this survey. These variables are known as the “Synthetic Indicators” and their generation and relation to the other variables is described in the Excel file *Estructura\_individuos\_ECV99.xls*, which is attached together with all the related documentation in the ECV 1999 microdata file.

### 5. Description of variables

Includes the literals corresponding to the coding of each of the variables included in the file. See Appendix I.
